Anatomy of an Asthma Attack

How to Avoid an Asthma Emergency
Asthma Attacks rarely happen without warning. Knowing the signs of a pending attack could help you prevent an asthma emergency. In fact, acting quickly could save your life.

Asthma Early Warning Signs
- A lack of appetite, fatigue, headache, or coughing often comes before an asthma attack.
- Trouble sleeping and feeling tired are other typical signs.
- So are dark circles under the eyes and less tolerance for exercise.

A Persistent Cough
Signs of an asthma attack can change from one attack to the next. One time there may be little or no coughing before an attack. The next time, there may be a persistent cough, especially at night. An Asthma cough is usually dry and hacking. A chronic or persistent cough that doesn’t disappear after other cold symptoms are gone could point to asthma. Avoid taking cough medicine. Cough medicine won’t help the asthma.

Measurable Changes in Breathing
A peak flow meter can alert you to a pending attack. Be sure you always know your baseline measurement that reflects your best breathing.
- If your peak flow shows numbers between 50% and 80% of your personal best, an asthma attack has probably started.
- A number below 50% means an emergency that needs immediate attention, call 911
- Call 911 if you have trouble walking or talking due to shortness of breath, or if your lips are blue or gray.

Follow Your Asthma Action Plan
(cdc.gov/ASTHMA/actionplan.html)

An action plan tells you how to deal with symptoms of an asthma attack.

- Based on peak flow measures, an asthma plan shows you what medicines to take and when. It’s important to follow the plan and use the medications exactly as prescribed.
- If the symptoms get worse after following the action plan, call your asthma doctor. Also, follow the plan’s emergency instructions.

Breathing Difficulties

During an asthma attack, muscles around the airways tighten, and the airway linings swell.

- Too much mucus secretion is produced in the airways and can block the air tubes in the lungs.
- Air is trapped in the lungs and breathing becomes difficult.

You might notice symptoms of wheezing at first. But as attacks get worse there’s more chest tightness and shortness of breath. Eventually, you might feel like you can’t get enough air.

Posture Changes

The effort to breathe may make someone with severe breathing difficulties lean forward and speak in words instead of sentences, and become noticeably agitated. As the severity increases, an asthma sufferer may increasingly move into a hunched-over sitting position with their hands supporting their body. This is called the tripod position.

Blue Lips or Fingernails

Blue or gray lips or fingernails are a sign of not enough oxygen in the blood. The condition is called cyanosis. Cyanosis is an emergency situation. Call 911 as soon as possible.

Other Signs of Asthma Emergencies

If you notice any of the following, get emergency help at once:

- Difficulty talking
- Inability to exhale or inhale
- Shortness of breath
- Feelings of anxiety or panic
- Coughing that won’t stop
- Pale, sweaty face
- Call me anytime with questions
